

Weather34 Aurora MKII

Weather34 Aurora MKII(Vantage) setup guide to get up and running in a matter of minutes .

Designed For Meteobridge

Designed For Davis Vantage

Step 1

1.* Goto Weather Nets tab as shown in screenshot below and under Add more Weather Networks scroll down and look for the Weather34 option in the add more networks

Step 2

2.* Now select from the menu HOME WEATHER STATION Weather34 in the Weather Nets Tab and you should see the Weather34 ICON appear with the interval option.

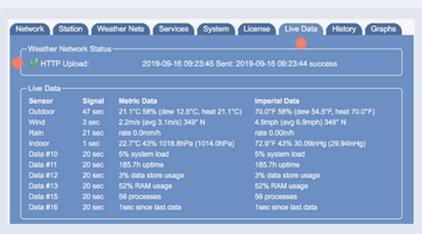

Step 3

3.* Now in the API url box enter your path for the Meteobridge to upload too example https://yourdomain.com/mbridge/mb.php Select the interval rate you wish to upload at.

Step 4

4.* Now Click Save You should now see a green tick in the weather network status indicating successful upload. If not likelihood is the incorrect path was typed in the API url of step 3

Now Check Your Website

Check * If all was followed correctly should be updating as per the interval that was set in step 3. If not updating accordingly double check the path you typed in step 3.

Check the path example https://yourdomain.com/mbridge/mb.php
